Swarm Rescue Challenge
Evaluation Report

Generated on 15/10/2026 - 08:07

Team n°6: SkySaviors

Members: tom, alice, bob, lea

Final score: 97.0 / 100

Calculation of the score

For each round, different scores are calculated:
- Srescue, the score of rescues. This is the proportion of bombs that return to the disposal station,
- Shealth, the health return score. It depends on the drones and their health returning to the return area,
- Stime, the ratio of the time remaining to the time limit, after all the bombs have been rescued.

A "round score" Sr is calculated for each round using this formula:
Sr = (0.6 * Srescue + 0.2 * Shealth + 0.2 * Stime)*100
Then, each configuration (map + zones) is averaged over several rounds to generate a 'config score.'

Finally, a final score is calculated as a weighted average of the config scores.

Description of the configurations

Configuration n°1:
- map: Map03
- special zones: none
- number of rounds: 1
- weight for final score: 1.0

Detailed statistics

In this table below, you will find the score for each configuration and round.

Config n°	Round n°	Rescued Sc.	Explo Score	Return Score	Time Score	Round Score
1	1	100.0 %	100.0 %	85.0 %	100.0 %	97.0 %

Average computation frequency over all rounds: 24.5 steps/s.

Percentage of drones destroyed in collisions over of all rounds: 0.0 %.

Average percentage of drone health over all rounds: 85 %.

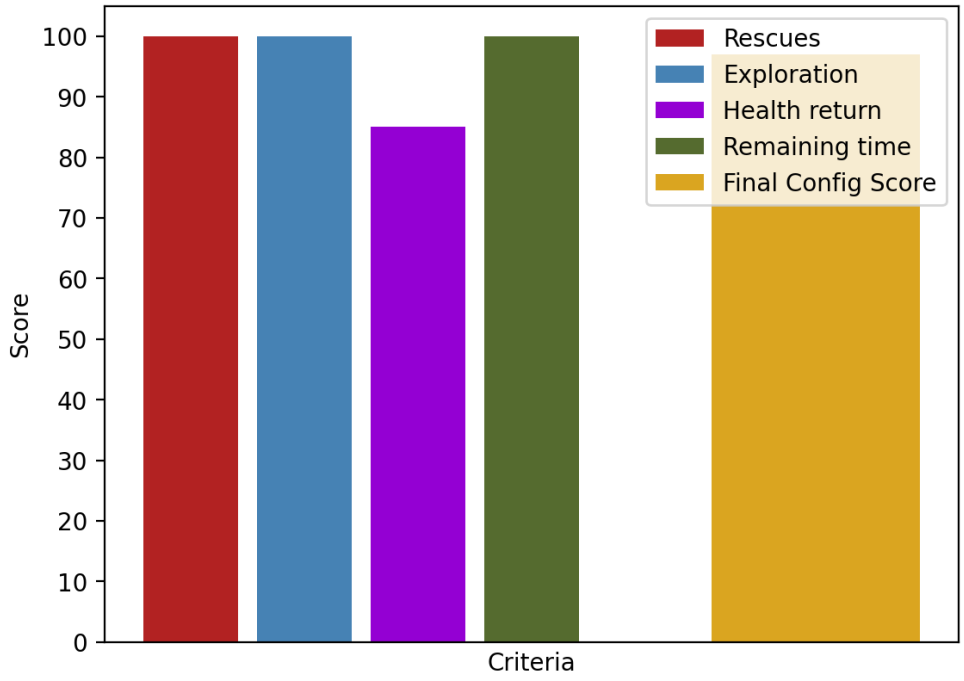

Summary statistics

In this table below, you will find the average score, across all rounds, for each configuration.

Config n°	Config Weight	Config Score
1	1.0	97.0 %

We can now calculate the final weighted score: 97.0 / 100

Graphic illustration of the scores

Simulation details with the configuration n°1

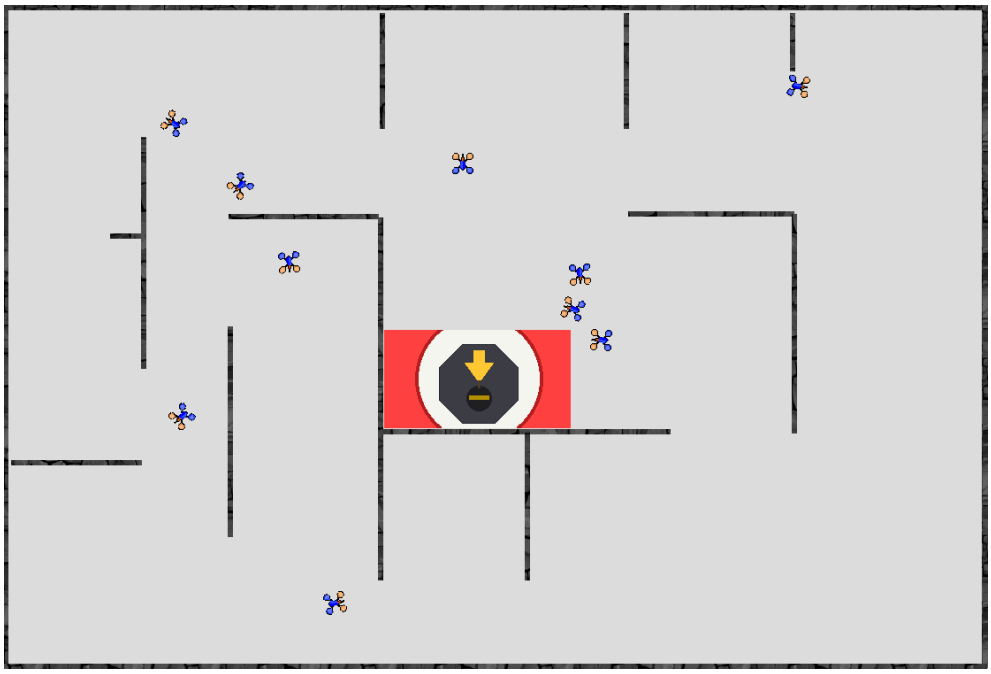

Configuration n°1:
- map: Map03
- special zones: none
- number of rounds: 1

Best round: n°1, score = 97.0 %

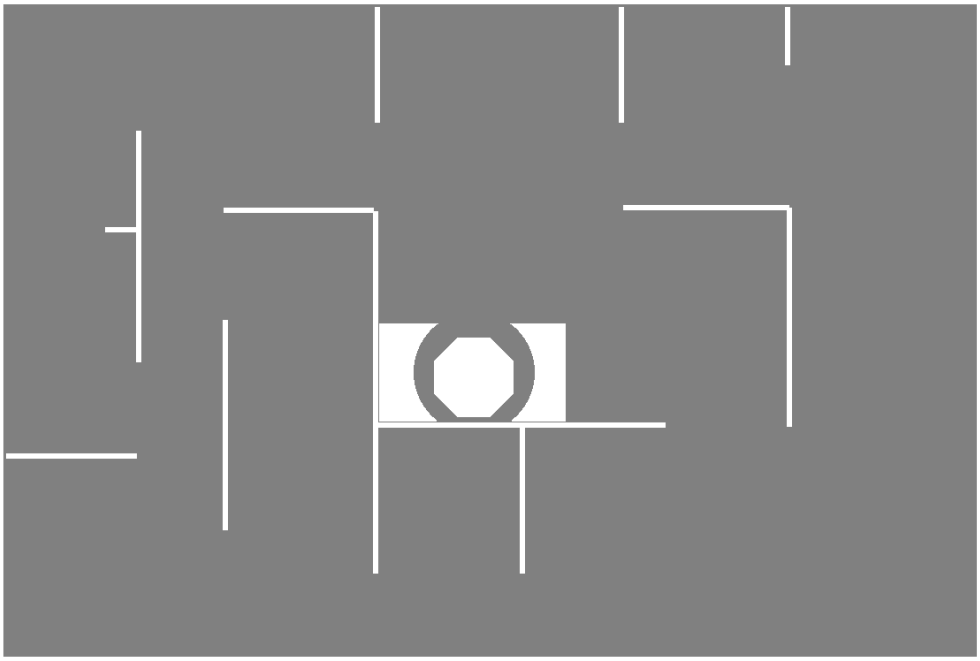

Mean computation frequency = 24.5 steps/s

Percentage of drones destroyed = 0.0 % and percentage of drones health = 85 %
